

PRESS RELEASE

March 30, 2007

AMDi has achieved another milestone in its 10 year history by manufacturing a new product line of AAC devices and Activities

AMDi presents... the Smart Series and Smart/Ease

Smart Series

Our new Smart Series (Talk, Speak, Scan, and 128) has incorporated some new features, including a smart overlay system, an interchangeable flash memory system, a slimmer profile, a handle for easy carrying, controls hidden behind a door and a recording and low battery indicator located on the grid.

Smart/Ease

A wide variety of pre-made activities (15 and counting) allow users to customize each Smart Series device. Choose Smart/Ease activities that are appropriate for your child's individual needs. Activities help students meet curricular goals. Children can engage in their favorite activities in a whole new context.

Each activity has been pre-keyed for your convenience. This makes changing levels quick and easy. Simply change the overlay and the level is changed accordingly. The Smart Series device senses the hole pattern on the overlay.

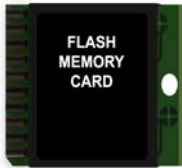

Each activity comes with an Interchangeable Flash Memory Card. Each flash memory card holds 6 levels of recorded voice with up to 30 minutes of recording time, allowing users unlimited amounts of levels on each device.

Features:

- Flash card with pre-recorded voice
- Pre-printed & keyed overlays
- Message Maps
- Introduction & Application card

Smart Overlay System

Each overlay can be keyed by simply punching a hole in the designated area, using a standard hole punch. This will make changing levels quick and easy. Simply change the overlay and the level is changed accordingly. Each Smart Series device senses the hole pattern on the overlay.

Interchangeable Flash Memory System

Each interchangeable flash memory card holds 6 levels of recorded voice with up to 30 minutes of recording time. This will give you unlimited amounts of levels on your device.

Smart/128... The Next Step to Dynamic Device

Our newest Smart/128 AAC device features 128 locations that allow for more extensive communication. As our Smart Series Family continues growing, our Smart/128 maintains all of the functions, features and benefits of the Tech/Series. Durability and affordability are preserved at the highest of standards. This new device features a transparent top grid which can be easily removed. With the grid, the Smart/128 is a standard static 128 location AAC device. Without the grid, the Smart/128 can be used as a pictorial communication device. This key feature brings an added level of versatility to our new device.
